

## EXPT: 2 TCP CLIENT-SERVER COMMUNICATION USING SOCKET PROGRAMMING IN PYTHON

### Aim:

To study and implement socket programming in Python for establishing communication between a client and a server using the TCP/IP protocol.

### ***Introduction:***

Socket programming is a method used for communication between two programs running on a network.

It allows a client and a server to send and receive data through network connections.

Python provides a built-in module called `socket` that supports both TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) communication.

### ***Algorithm:***

#### ***Server:***

1. Import the `socket` module.
2. Create a socket object using `socket.socket()`.
3. Bind the socket to a host address and port using `bind()`.
4. Listen for incoming connections using `listen()`.
5. Accept a connection using `accept()`.
6. Receive data from the client using `recv()`.
7. Send a response to the client using `send()`.
8. Close the connection using `close()`.

#### ***Client:***

1. Import the `socket` module.
2. Create a socket object using `socket.socket()`.
3. Connect to the server using `connect((host, port))`.
4. Send data to the server using `send()`.

5. Receive a response from the server using recv().

6. Close the connection using close().

**Code:**

**SERVER:**

```
import socket

sockfd=socket.socket(socket.AF_INET, socket.SOCK_STREAM)

print('Socket Created')

sockfd.bind(('localhost',55555))

sockfd.listen(3)

print('Waiting for connections')

while True:

    clientfd,addr=sockfd.accept()

    receivedMsg=clientfd.recv(1024).decode()

    print("Connected with ",addr)

    print("Message Received from Client: ",receivedMsg)

    clientfd.send(bytes(receivedMsg,'utf-8'))

    print("Message reply sent to Client!")

    print("Do you want to continue(type y or n):")

    choice=input()

    if choice=='n':

        break
```

**CLIENT:**

```
import socket

clientfd=socket.socket(socket.AF_INET, socket.SOCK_STREAM)
```

```
clientfd.connect(('localhost',55555))

name=input("Enter your message:")

clientfd.send(bytes(name,'utf-8'))

print("Message Received from Server: ",clientfd.recv(1024).decode())
```

**Output: Server:**

Command Prompt - python s

```
Microsoft Windows [Version 10.0.26100.6584]
(c) Microsoft Corporation. All rights reserved.

C:\Users\angel>cd C:\Users\angel\OneDrive\Documents
C:\Users\angel\OneDrive\Documents>python server.py
Socket Created
Waiting for connections
Connected with ('127.0.0.1', 52581)
Message Received from Client: Hello
Message reply sent to Client!
Do you want to continue(type y or n):
```

**Client:**

Command Prompt

```
Microsoft Windows [Version 10.0.26100.6584]
(c) Microsoft Corporation. All rights reserved.

C:\Users\angel>cd C:\Users\angel\OneDrive\Documents
C:\Users\angel\OneDrive\Documents>python client.py
Enter your message:Hello
Message Received from Server: Hello

C:\Users\angel\OneDrive\Documents>
```

***Result:***

The implementation of socket programming in Python was successfully executed. A TCP connection was established between the client and the server, enabling successful message exchange.
